

Abstract

5 A mobile communications terminal for use in a cellular
communications system e.g. CDMA systems, comprising an
electronic circuit (200) for receiving a wire-less
communications signal carrying signal channels having
processing means for extracting the signal channels. The
electronic circuit (200) is adapted to classify a type of
interference, affecting the communications quality, by
10 evaluating signals selected in the electronic circuit
that are selected as signals having information for
classifying a type of interference in one of at least two
predetermined classes of interference.
